

P20020.A02

end thereof to generate image-pixel signals, an image-signal processing unit that produces
A3
a video signal on the basis of the image-pixel signals, and a TV monitor for reproducing and
displaying an endoscope-image in accordance with the video signal.---

Please substitute the following paragraph for the paragraph starting page 1, line 13:

---(Clean Text) | In such an electronic endoscope system, a CCD
(charge-coupled-device) image sensor is usually utilized as the solid-state image sensor, and
A3
is associated with an objective lens system provided at the distal end of the flexible scope.
Also, a flexible optical guide, formed of a bundle of optical fibers, is extended through the
flexible scope, and is associated with a lighting lens system provided at the distal end of the
flexible scope.---

Please substitute the following paragraph for the paragraph starting page 4, line 10:

---(Clean Text) | In accordance with the present invention, there is provided an
electronic endoscope system including a scope having a solid-state image sensor provided
at a distal end thereof to generate image-pixel signals, an image-signal processing unit that
A3
produces a video signal based on the image-pixel signals, and a monitor for reproducing and
displaying an endoscope-image in accordance with the video signal output from the
image-signal processing unit. The electronic endoscope system comprises a scene-changing
system that changes a scene on the monitor between an endoscope-image-display scene and
a patient- data-list-display scene, a storage system that stores patient data forming a patient

P20020.A02

data list which is displayed on the monitor when the scene on the monitor is changed from the endoscope-image-display scene to the patient-data-list-display scene by the scene-changing system, a selection system that selects individual patient data from the patient data list displayed on the monitor, and a display-control system that displays the selected individual patient data together with the endoscope-image on the monitor when the scene on the monitor is changed from the patient-data-list-display scene to the endoscope-image-display scene by the scene-changing system.---

Please substitute the following paragraph for the paragraph starting page 8, line 17:

---(Clean Text) [The scope 10 has a solid-state image sensor 14, such as a CCD (charge-coupled-device) image sensor, provided at a distal end of the flexible conduit thereof, and the CCD image sensor 14 is associated with an objective lens system (not shown). Also, the scope 10 includes a flexible optical light guide 16 extended therethrough and formed of a bundle of optical fibers. The optical light guide 16 terminates with a light-radiating end face at the distal end of the flexible conduit of the scope 10, and is associated with a lighting lens system (not shown) provided thereat. When the connection is established between the scope 10 and the image-signal processing unit 12, the proximal end of the optical light guide 16 is optically connected to a white-light lamp 18, such as a halogen lamp, xenon lamp or the like, provided in the image-signal processing unit 12, whereby light is emitted from the light-radiating end face of the optical light guide 16.---

Please substitute the following paragraph for the paragraph starting page 23, line 13:

Alc
---(Clean Text) The conversion of the digital color video signal components (R, G and B) into the analog monochromatic video signal components (Ra, Ga and Ba) by the D/A converters 34R, 34G and 34B is performed in accordance with either the first series of clock pulses or the second series of clock pulses, output from the timing controller 48, which are symbolically indicated and represented by references CLK1 and CLK2 in Fig. 5. Of course, as is apparent from the foregoing, when the analog monochromatic video signal components (Ra, Ga and Ba) are derived from a relatively-large-size CCD image sensor (14), the first series of clock pulses CLK1 is output from the timing controller 48, and, when the analog monochromatic video signal components (Ra, Ga and Ba) are derived from a relatively-small-size CCD image sensor (14), the second series of clock pulses CLK2 is output from the timing controller 48.---

Please substitute the following paragraph for the paragraph starting page 31, line 19:

AN
---(Clean Text) At step 802, if CHN-FL1 = 1, i.e. if the patient data list is displayed on the TV monitor 38 (Fig. 3), the control proceeds from step 802 to step 811, in which the first scene-changing flag CHN-FL1 is set to "0".---

Please substitute the following paragraph for the paragraph starting page 35, line 25:

As cont
---(Clean Text) At step 820, if CHN-FL2 = 1, i.e. if the patient data list is displayed on the TV monitor 38 (Fig. 3), the control proceeds from step 820 to step 829, in which the
